

The Camel Photostory. Camels and the Trees

Description

The camel is unique and survives in unique but challenging conditions. Their habitat is composed of sand, resilient vegetation, soaring heat, desert storms, sporadic rains, long sunny days, and little or no water. In spite of such challenging conditions, we expect camel to secure our food supply and ensure our livelihood. One can feel the connection between nature and life in the photograph.

The Nature Connections

This picture was shot on the year's longest day of June 21, 2020 (Alain, UAE) to highlight the importance of the camel in challenging temperatures. The camel keeper can be seen sitting under the Prosopis tree and the camels, trees, and the sand make together a piece of music played by the wind of the desert.
