

CaM-Immune Works Better than Normal Camel Milk- A Claim by Millie Hinkle

Description

Cam-Immune shown extremely positive results on Cancer Patient

Research with cancer patients and Cam-Immune shown extremely positive results. Gave Cam-Immune immediately before chemo therapy treatment and again immediately after treatment. The high levels of antioxidants, antibodies, etc. in the Cam-Immune seems to act as a carrying agent for the chemotherapy directly to the tumor without any of the negative side effects normally experienced by patients. Shrinkage of tumors observed in radiological tests. Seeking camels and funding for further studies here in US.

Also very Positive Impact on the Autistic Kids

Observation of autistic children showed rapid response compared to just regular camel milk. Autistic children on Cam-Immune had improvement in eye contact, verbal response, cognitive measurement response and motor skill improvement within a shorter period of time than children on regular camel milk.

The best and acceptable way would be a comprehensive study with highly scientific methodology/ies in different ecological regions of the world, where a team of scientist with the diverse background is involved.
