

The Camel Milk is a Hope for a Sustainable Camel Development in Australia

Description

Behind the Australian Camels

I'm behind the Australian camels for the last 15 years. I'm a witness of very sad and happy news about the feral camels of Australia. A recent post tells the insight of the camel dairy development in the country. There is good hope, I think it will develop the camel business very sustainably. Though the development is still very slow and steady it will provide a strong base for a camel business in the future.

The Feral Camels Provide the Base

Most camel farmers in Australia start their herds by capturing wild camels from the outback or rescuing culled animals destined for an abattoir, helping control a feral population that is increasing about 8 percent a year.

AgriFutures Australia estimates the local camel milk industry produced about 180,000 liters in 2019, up from 50,000 three years ago. Globally most camel milk production is in the Middle East and North Africa but Australian farmers have a strategic advantage because our camels are free of a disease common elsewhere.
