

The Camel Community Urge UAE to Lead a Sophisticated Research on Camel Milk amid COVID-19

Description

Since unknown times, camel milk has been considered as protection and medicine for different complex health issues. In the recent past, some scientific studies have proved the camel milk as a source of super healthy molecules, with strong healing power. There are strong believes and proofs that camel milk enhances the overall strength of the body to cope with the infections and stressful conditions.

The ongoing health crisis all over the world has realized the importance of natural ingredients to support our healths and combat viral attacks and other infections. The whole world is desperately looking for healthier and safe options to protect human health in challenging health crisis.

Hightime to Investigate the Camel Milk

It is the best time to investigate the potential medicine in camel milk to give ease and hope to the people in distress and pains. Camel milk comes from a very sustainable and environmentally friendly production system. If camel milk is proved as an immune booster and protective agent against the infections and viral attacks, then it will be a two-prong success for humanity, natural medicine, and supporting sustainable farming systems.

Trial Studies can Uncover the Truth

It is the best time to design trial studies with the camel milk on COVID-19 patients. The microbiologist, health professionals, camel experts can jointly launch very sophisticated trial studies of camel milk and can find the results with huge data on the overall health status and immunity on COVID-19 patients.

UAE can Lead the Research

UAE has visionary leadership, sophisticated institutions & labs, money, camels, and camel milk, the only country in the world blessed with all treasures at the same time. We, therefore suggest starting sophisticated scientific research & harvest the potential antibodies found in camel milk. ***Researchers in Belgium announces potential breakthroughs using the camelids's™ antibodies (Llama) in COVID2019. The large camel dromedary is the closest relative of the Llamas.*** No better place for such research, UAE has always presented innovative scientific ideas, scientific solution to COVID-2019 through camel antibodies will be an incredible experience to the world.

Why Investigate Camel's™ Immunity?

As MERS (another type of coronavirus) in camel and camels survive with it for hundreds of years, then their antibodies are working, we are quite sure. This 'may' mean people drinking camel milk might have a stronger immune, due to their body antibodies developed over time, in combination with 'stuff' from camel milk.

Food for Thought

My suggestion or desire is based on the magical realities related to the incredible camel. I hereby suggest through this post to please investigate the camel milk as a potential immunity booster in complicated infections like COVID-19. Not only the milk but the plasma's antibodies of the Arabian camel can give hope to the people in pain amid this health emergency crisis.
